

## Concrete Sidewalk Repairs

- 1. Identify and mark areas of repair.
- 2. Saw cut or jackhammer the perimeter of each area.
- 3. Excavate and dispose of existing concrete down to subbase.
- 4. Recompact subbase material. Add new subbase material if necessary.
- 5. Set forms and pour new 3500 P.S.I. concrete to the proposed thickness.
- 6. Finish concrete to new or existing grades, score joints and broom finish.
- 7. Once concrete has set up, forms will be removed and back fill with existing soils.
